

The Galapagos Islands
An Evolutionary Community

Elise Fancourt
726322

Based in the Galapagos Islands, the project proposes a series of interventions into the education, tourism and food production systems, which address many of the problematic conditions facing the Galapagos Islands.

These interventions aim to change perceptions of both local and tourist communities, enhancing the connections between people, place and nature, and stimulating the evolution of the Galapagos into an socio-ecological community.

The project reshapes the education system and current learning environment with a system of transportable modules which form Education Communities. These dissolve the existing boundaries, enabling the unique natural ecosystems to become the everyday learning environment and enhancing the connections between people, place and nature.
